

Build your own jig

Create a jig from your own documents, data and skills, and keep a copy of each document in it so answers can link to their source.

development · 2026-11-22

Build your own jig

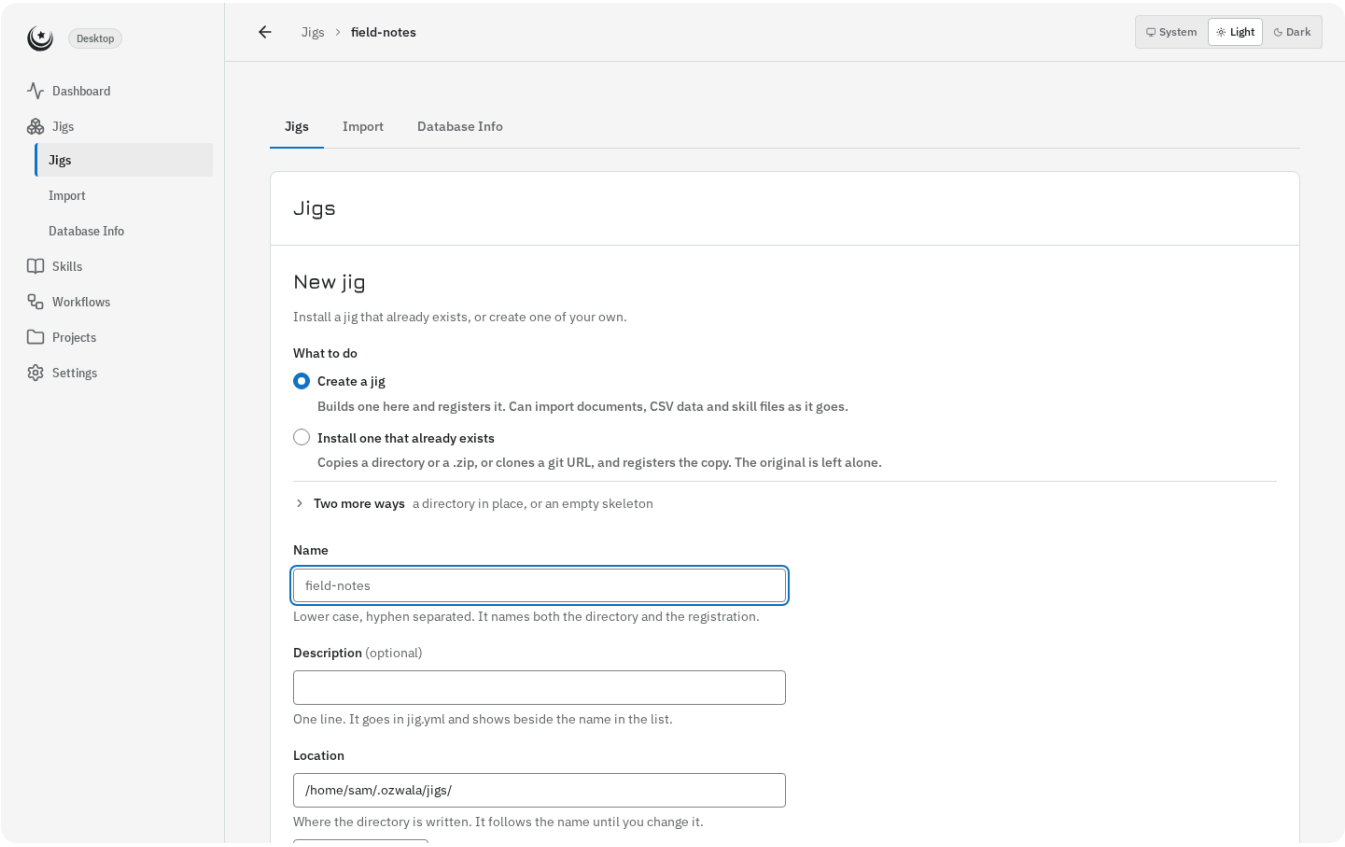

A jig of your own starts from what you already have: a folder of documents, a spreadsheet of data, skill files you wrote. Ozwala indexes the documents and data so an agent can ask about them, with each answer citing the passage it came from.

Each task below names the command that does the same from a terminal. `ozwala` is the desktop app's own command; the command-line download is called `ozwalina`, and takes the same commands.

Create a jig

1. On **Jigs**, choose **New**. **Create a jig** is chosen already.
2. Give it a name, lower case and hyphenated, such as `field-notes`, and a one-line description.
3. Add what it starts from: **Add a folder…** or **Add a file…** for documents, CSV data, and skill files.
4. Choose **Create**.

The panel beside the form says, before you create anything, exactly what will be written and where.

Indexing documents needs an embeddings model, which Get started sets up from your environment (see Set Ozwala up).

From the command line: `ozwala jig create <name> --docs <folder> --data <file.csv> --skill <file>`.

Keep a copy of each document in the jig

Tick **Keep a copy of each document in the jig** when you create it. Each document is copied into the jig's `assets/` folder as well as indexed, so a citation in an answer links to the file itself, at its page for a PDF, and an exported archive carries the documents with it.

The jig's details on **Jigs** list what it carries under **Assets**, and **Open folder** shows them.

From the command line: `ozwala jig create <name> --docs <folder> --bundle`; `ozwala jig info <name>` lists the assets.

Give it to your agents

A new jig is given to every configured agent, so its skills reach them straight away. To choose, see Give skills to your agents.
