

Get Ozwala

Download the desktop app or the command line from ozwala.com, and check which version you have.

Get Ozwala

Ozwala comes two ways, from the releases page on ozwala.com (https://ozwala.com/releases): the **desktop app**, `ozwala`, which these pages describe and which also takes every command, and the **command line** alone, `ozwalina`, for servers, scripts and anyone who prefers a terminal. Both read the same configuration in `~/.ozwala`, so you can use either, or both, on one computer.

Download a release

Open ozwala.com/releases (https://ozwala.com/releases). It names the current release; download the build for your computer and run it. The first time the app opens, Get started sets it up: see Set Ozwala up.

The command line runs as it is, with nothing else to install: `ozwalina version` says which release it is.

Check which version you have

The app shows its version at the foot of the sidebar. It is the version the releases page names, so a bug report that quotes it names a real release.

From the command line: `ozwala version` (or `ozwalina version`).

What changed in each release is at ozwala.com/releases (https://ozwala.com/releases).
