Your ozwala.com account

Your ozwala.com account is the one you use for the members' forum, bug reports and downloads. The app asks you to sign in when Get started finishes; it can wait. Ozwala works without an account, and so do scripts and pipelines that use the command line.

Each task below names the command that does the same from a terminal. `ozwala` is the desktop app's own command; the command-line download is called `ozwalina`, and takes the same commands.

Sign in

1. Open **Settings** > **Account** and choose **Sign in with your browser**.
2. Your browser opens ozwala.com's own sign-in page, with a code. Sign in there as usual, with two-factor if you use it, check the code matches, and choose **Allow**.

The app then says which member it is signed in as. It never sees your password, and the app and the command line share one sign-in.

From the command line: `ozwala account login`; `ozwala account status` says who is signed in. Over SSH it prints the link and the code for you to open anywhere.

Sign out

Settings > **Account** > **Sign out** ends this computer's access to your account on the site as well as here.

From the command line: `ozwala account logout`.

Reset a forgotten password

Start a sign-in as above; on ozwala.com's sign-in page, choose **Forgot your password?** and give your email address. The mail it sends leads back to ozwala.com, where you choose a new password. From then on the new password signs you in, and the old one does not.

Give a script a personal token

A script cannot choose **Allow** in a browser. Make a personal token on your ozwala.com settings page and give it to the script in `OZWALA_TOKEN`: the command line uses it in place of any stored sign-in. Revoking the token on the same page signs the script out, with nothing to change on the machine where it runs.

Your account lives at ozwala.com (https://ozwala.com).
