Release a new version of a jig

An author cuts a release: the version is bumped in jig.yml, committed, tagged and pushed, and on GitHub and GitLab a release page is made with the notes. On a service with no API, the tag is all there is.

What you can count on

- A release writes the new version into jig.yml and pushes a vX.Y.Z tag
- On GitHub the release has a release page with its notes
- On GitLab the release has a release page
- On a service with no API, the release is the tag and nothing else is called

Where it works

In the desktop app and on the command line. Each of these is checked, on every surface named, by the ozwala-usecases harness.
